(1) Staff and Students

Professor: Yukio Kato
Associate Professor: Mitsuhide Noshiro
Research Associate: Takeshi Kawamoto , Katsumi Fujimoto
International Student: Tania Saskianti
Secretary: Misano Kuramoto

(2) Main Research Activities

- 1) Basic and clinical aspects of mesenchymal stem cells
- 2) Differentiation of chondrocytes
- 3) Molecular clocks

We cloned novel bHLH transcription factors (Dec1 and Dec2), which play roles in differentiation of mesenchymal stem cells (MSC) into chondrocytes, adipocytes, myoblasts and osteoblasts. Furthermore, Dec1 and 2 are involved in core feed back loops of the transcriptional and translational control in molecular clock systems (Honda-S et al. Nature, 2002). In addition, we developed the super-expansion method for MSC and found many molecular markers for MSC.

**Program for Biomedical Research,
Division of Molecular Medical Science
(Department of Bacteriology)**

The study of infectious disease is a constantly challenging field that deals with the emergence and reemergence of diseases as threats to human beings, and drug resistance of bacteria through combat in host-parasite interaction. The research into the basic molecular mechanisms by which bacteria cause disease and become resistant to certain antimicrobial drug is essential for the development of new therapeutic interventions. Molecular bacterial pathogenesis, biogenesis and regulation of cell wall metabolism, and molecular aspect of host-parasite interaction are the research focus of our group of laboratory of bacteriology. Our work concentrates on human pathogens such as *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and oral pathogens *Aggregatibacter actinomycetemcomitans*, oral streptococci
